

PET REALM · Halo & Horns

Production World — Map Builder Brief & Quote Request

We are commissioning the production world for a live Roblox game. **You build geometry and place invisible marker objects; you never touch game code.** Every gameplay system binds to the map at boot through named objects, CollectionService tags, and attributes — we supply the complete marker inventory, helper tooling for bulk tagging, and a preview place that shows your work under each zone's final lighting. If a required hook is missing, our engine reports the exact path at boot: integration is verifiable, not guesswork.

What we're asking you to quote: Phase 0 (layout graybox) and Phase 1 (full art pass on the base layer) as a fixed bid, plus a per-layer rate for Phase 2 (ten reskins of the same layout). Details in §6.

1. The game in 60 seconds

Pet Realm is a heaven-and-hell pet game: players mine crystals, hatch and grow squads of pets, fight alongside them with an ability kit, and choose a direction — ascend five Heaven layers or descend five Hell layers. Pets are the stars: the camera lives at player scale and the world is the stage for 10+ pet models per player plus enemies.

- **Heaven = coexistence.** Radiant, peaceful, farm-friendly; danger is chosen.
- **Hell = hostility.** Ember-lit, aggressive — and genuinely DARK in the deepest layers. The darkness is a game mechanic (players bring lantern pets); do not brighten it away.
- **Depth = desirability.** Each layer up/down raises enemy levels, payouts, and prestige. The apex layers are endgame showpieces.
- **Trials** (procedural dungeon missions) launch from gates inside realm layers. Their interiors are generated by code — you never build mission interiors.

Art direction: low-poly stylized (Synty-adjacent), saturated, readable at distance, mobile-friendly. We will share in-game reference captures of our existing dungeon interiors — they are the quality bar.

2. World architecture: ONE layout, ELEVEN skins

The world is one layout replicated eleven times, stacked vertically 2,000 studs apart. **The layout is identical on every layer** — same footprint, paths, and marker positions. Only the dressing changes (materials, props, foliage, color story, architectural flavor). Your work is one layout plus ten reskins, not eleven worlds.

Layer	Y band	Skin story
Heaven 5	+10,000	The Empyrean — near-white radiance, floating geometry (apex showpiece)
Heaven 4	+8,000	Astral courts — white-gold architecture, light beams
Heaven 3	+6,000	Crystal gardens — prismatic crystal, pale gold, glass
Heaven 2	+4,000	Cloudlands — marble, white stone, drifting clouds
Heaven 1	+2,000	First ascent — gold trim on natural forms, soft whites
HOME	0	The vibrant natural world — the first-impression layer, most polish here
Hell 1	-2,000	First descent — ash, ember cracks, charred familiar forms

Layer	Y band	Skin story
Hell 2	-4,000	The furnace — basalt, lava veins, chains, spikes
Hell 3	-6,000	Jagged spired wastes — obsidian, red-glow accents (still visible)
Hell 4	-8,000	The gloaming — near-dark, isolated ember lights, no sun
Hell 5	-10,000	The abyss — near-black silhouettes, rare red glows, emissive accents only

Skyboxes, fog, and color grading per layer are already built into the game engine — you design geometry to each palette; we apply the atmosphere. We provide a preview place that shows your map under all eleven grades.

The layout: hub-and-spoke

- **HUB (center):** the social core — player spawn, the realm-portal plaza (ten portals: five heaven, five hell), an egg-hatcher court, shop/enchanter/altar anchors, daily-reward chest, trade space. Compact: a new player should see every affordance in one camera sweep.
- **FOUR SPOKES (biomes):** Earth (grass), Ice, Lava, Desert. Each spoke: an open crystal-farming field (a real walkable surface mesh), an enemy area, an egg hatcher, and an unlock gate at its mouth. Spokes get longer/wilder away from the hub.
- Spokes must be visually distinct at a glance (silhouette + color) — the element drives combat mechanics and loot identity.
- On realm layers each spoke wears the layer's theme *tinted by its element* — Hell 2's Ice spoke is black ice; Heaven 1's Lava spoke is golden magma.

Scale guardrails: pets are big (up to ~6x player scale) and squads are 10+ models per player. Paths comfortably 30+ studs wide, farming fields open, no pinch-points under ~14 studs.

3. Hard technical rules

- **Everything anchored; no gameplay scripts.** Game logic is ours. A model MAY carry a small self-contained decorative animation script (a spinning windmill, a swaying sign) provided it touches nothing outside its own model, uses no remotes/network or global state, and prefers TweenService over per-frame loops — hundreds of these must coexist. Anything affecting gameplay, other instances, or players fails acceptance.
- **StreamingEnabled is ON.** Build modular chunks; no single mega-mesh per spoke; use LODs where available.
- **Reserved coordinates:** leave $X \geq 24,000$ empty at every height (procedural dungeon band); also leave the $X = 20,000$ band clear.
- **Deliver at origin.** You build each layer's content at $Y = 0$; we place the vertical clones.
- **One folder per layer**, named exactly: Home, Heaven_1...Heaven_5, Hell_1...Hell_5.
- **Name meshes in your DCC tool.** Our import pipeline names MeshParts from the mesh DATA name, not the file name.
- **No baked lighting assumptions.** All lighting/sky/fog comes from our engine per layer.

- **Asset ownership:** uploaded meshes/textures must be uploaded to our Roblox group (we provide access) so assets never break for other team members.

4. The marker contract (what the map must carry)

Markers are CollectionService tags with attributes, or exact reserved names. We supply full attribute schemas, bulk-stamping helper scripts, and run the acceptance boot on every delivery. Counts below are per layer.

Zones, spawns, farming

Hook	Form	Notes
Area volumes	AreaZone tag + Areald	One for the hub + one per spoke; player location resolves against these.
Player spawn	PlayerSpawn tag on the hub SpawnLocation	One per layer.
Farming surfaces	SpawnZone tag on each spoke's walkable surface mesh	Crystals spawn onto this surface by raycast — it must be a real queryable mesh, kept reasonably clear of props.
Unlock gates	Gate model at each spoke mouth	Sequential zone unlocks; visual door/arch, we handle logic.

Travel

Hook	Form	Notes
Realm portal plaza	Ten portals named Portal_Halo1...5 and Portal_Horn1...5	The layer ladder. Interaction binds to the named part (Model -> PrimaryPart). Double-faced back-to-back portals are supported; keep paired faces' anchor parts >= 4 studs apart.
Trial gates	A door part tagged MissionDoor (attribute supplied)	One per REALM layer (none on Home), placed inside that layer's folder.
Teleport pads (optional)	TeleportPad tag	Hub <-> spoke-end conveniences.

Content anchors

Hook	Form	Notes
Egg hatchers	Authored decorative models in an EggHatchers folder; interaction part tagged EggStand	One per spoke + a hub court. You design the hatcher look; we attach behavior.
Enemy cave anchors	Parts named BaddieSpawner<Element> in realm layers	Marks where enemy bands den.
Enemy leash regions	Simple invisible named parts over each combat area	We reference them by name in config; footprint = the pen enemies stay in.
Hub services	EnchanterStation / ShopAnchor / NPCAnchor / PODPodium tags + the Ascension Altar and daily chest models	Hub court placements; altar/chest models can be restyled per layer.

What you do NOT build

- Dungeon/mission interiors (procedurally generated).
- UI, lighting rigs, skyboxes, gameplay scripts.
- Crystals, spawned egg visuals, enemies, pets — all spawned by code onto your markers.

5. Process, deliverables, acceptance

Phase	Deliverable	Notes
Phase 0 — Graybox	Hub + four spokes blocked in primitives at origin, all markers placed. One .rbxl or .rbxm under a single Maps/Home folder.	We boot-test and playtest; layout iterates here while moving things is cheap. Layout questions in section 7 get settled during this phase.
Phase 1 — Dress HOME	Full art pass on the base layer.	This layer ships alone first (it is our marketing gate) while reskins proceed.
Phase 2 — Reskin ladder	Ten re-dressed copies of the same layout, one per layer brief (section 2 table). Markers must not move — we diff marker transforms.	Order: Heaven 1 and Hell 1 first, apex layers last. Quoted per layer.

Acceptance per delivery (we run, you get the report):

- Engine boot with map binding validation — zero warnings/errors, hook census matches the manifest.
- Decorative-script audit: each is self-contained, tween-based, and inert toward gameplay.
- Crystal spawn test on each farming surface (50 spawns, zero inside props or off-mesh).
- Walk test: spawn -> every spoke -> every portal -> trial gate prompt appears.
- Layer-warp streaming test: no fall-through, no visible hitching beyond a brief loading pause.
- Performance: layer within agreed part/triangle budget; 60 fps target on mid-range mobile.

6. What to include in your quote

- Fixed bid + timeline for Phase 0 and Phase 1.
- Per-layer rate + timeline for Phase 2 reskins (assume identical layout, dressing only).
- Your part/triangle budget recommendation per layer for mobile-first streaming.
- Portfolio links — stylized low-poly Roblox work especially.
- Anything in this brief you would push back on — we value builders who argue.

7. Layout questions we'll settle together in Phase 0

- Portal plaza form: a single row of ten portals, or a designed arrangement (heaven stair rising / hell pit descending)?
- Do spoke tips connect via an outer ring path, or stay pure spokes?
- A side-content pocket off the Desert spoke (four small gated zones) — where does it live?
- Trial gate placement on realm layers: hub-center drama vs. end-of-spoke journey?

- Cave/underground allowance per spoke (enemy dens) — how much verticality do you recommend?

Contact / next step: reply with your quote and portfolio. We'll follow up with group access, the marker schema pack, reference captures, and the atmosphere preview place.
